

45-degree angled cable tray relocation

AI Overview

Relocating a cable tray at a 45-degree angle requires using a 45° bend or horizontal elbow to maintain cable support and ensure smooth directional changes.

Choosing the Right 45° Fitting

For a 45° angled relocation, select a bend or elbow compatible with your cable tray system. Options include:

- Horizontal elbows for left or right directional changes, suitable for ladder or solid-bottom trays (Class 1–3 depending on NEMA rating) .
- Heavy-duty 45° bends made from hot-dipped galvanized steel for industrial applications, providing durability and corrosion resistance .
- Stainless steel 316 fittings for corrosive or outdoor environments, offering long-term reliability .
- Ensure the bend radius and side rail height match your existing tray to prevent cable stress .

Installation Considerations

- Alignment: Position the 45° fitting so the tray maintains a continuous support path. Misalignment can cause cable sag or mechanical stress.
- Support: Use appropriate hangers or brackets to support the bend, especially for heavy or long cable runs. Maintain recommended spacing per manufacturer guidelines.
- Splice Plates: Secure the elbow with splice plates or bolts matching the tray class to ensure structural integrity
