

Are galvanized cable trays metal cable trays Why

AI Overview

Yes, galvanized cable trays are metal cable trays, specifically steel trays coated with zinc for corrosion protection.

Galvanized cable trays are made from steel, which is inherently a metal, and then coated with zinc to prevent rust and corrosion, extending their lifespan in industrial and outdoor environments . The galvanization process can be done through methods like hot-dip galvanizing, where the steel is submerged in molten zinc, forming a durable metallurgical bond . This protective layer ensures that even if the tray surface is scratched, the underlying steel remains protected from corrosion .

Characteristics of Galvanized Metal Cable Trays

- Material: Steel base, making it a metal tray .
- Corrosion Resistance: Zinc coating provides sacrificial protection, ideal for moderate humidity or industrial settings .
- Cost-Effectiveness: Galvanized trays are generally more affordable than stainless steel trays while still offering durability .
- Applications: Suitable for routing electrical power cables, data cables, control wiring, and fiber optics in commercial, industrial, and outdoor installations .
- Installation: Easy to install with standard mounting hardware, offering organized cable management .
