

Cable conduits are included in the cable tray

AI Overview

Cable conduits are not inherently included in cable trays; they are separate protective systems that may be used with tray cables in specific situations.

Understanding Cable Trays

Cable trays are open structural systems designed to support and organize multiple cables in industrial, commercial, or large-scale installations. They allow cables to be laid rather than pulled, providing easy access for maintenance, heat dissipation, and future expansion without the need for additional bends or fittings (Ned-Tech, Simco Steel, EWCSWire) . Tray cables, such as TC or TC-ER types, are specifically manufactured to withstand industrial environments and can be installed directly in cable trays without additional conduit in many cases (L-Com) .

Role of Conduits

Conduits are enclosed tubes or pipes—rigid or flexible, metallic or nonmetallic—used to provide mechanical protection and environmental isolation for cables. They are particularly useful in areas where cables are exposed to impact, moisture, chemicals, UV, or underground conditions (Ned-Tech, L-Com) . Conduits are not automatically part of a cable tray system; they are added only when extra protection is required.
