

Cold Aisle Solutions for Computer Rooms

AI Overview

Cold aisle containment is an effective method to improve cooling efficiency, reduce energy costs, and maintain optimal server performance in computer rooms.

Overview of Cold Aisle Containment

Cold aisle containment involves enclosing the cold aisles—the rows where server intakes face—using doors at the ends and partitions or a roof over the aisle. This prevents the mixing of cold supply air with hot exhaust air, ensuring that servers receive consistent, cool airflow from CRAC (Computer Room Air Conditioning) or CRAH (Computer Room Air Handler) units . Unlike hot aisle containment, cold aisle containment is generally easier to retrofit in existing data centers, especially where overhead obstructions like ducts, lighting, or cabling exist .

Benefits

- **Energy Efficiency:** Cold aisle containment can reduce cooling-related energy costs by up to 30%, and studies have shown that electricity used to move cold supply air can be reduced by 75% .
- **Improved Temperature Control:** By separating hot and cold air, it minimizes hot spots and maintains a stable environment for IT equipment .
- **Quick Payback:** Retrofits can be implemented quickly, with payback periods ranging from weeks to a few months, depending on energy rebates and utility incentives .
- **Flexibility:** Cold aisle containment works with or without raised floors and can integrate with high-density cooling systems or extreme density setups
