

Composition of construction power distribution boxes

AI Overview

Construction site power distribution boxes are composed of robust enclosures, circuit protection devices, industrial connectors, internal wiring, and grounding systems designed for safe, temporary power distribution.

Enclosure and Materials

Construction power distribution boxes are typically housed in weather-resistant, impact-resistant enclosures made from sheet steel, thermoplastics, fiberglass, or polyester. These materials provide durability against dust, rain, and mechanical impacts, with protection ratings such as IP65-IP67 and impact resistance IK08-IK10 depending on the model . Some boxes feature internal doors and folding strain relief clamps to facilitate safe and organized cable entry and exit .

Circuit Protection

Inside the box, circuit breakers, fuses, and main disconnects are installed to protect connected equipment and personnel. These devices are often pre-wired and accessible through flip-up covers that prevent loss during maintenance . Boxes may include multiple circuits to distribute power efficiently across different tools and machinery, supporting both single-phase (230 V) and three-phase (400 V) loads .
