

# Connecting the optical distribution box to the OLT

## AI Overview

The OLT connects to an optical distribution box via the Optical Distribution Network (ODN), which includes fiber cables, splitters, and distribution hubs to route signals to multiple end users.

### Overview of the Connection Path

- **OLT (Optical Line Terminal)** The OLT is located at the service provider's central office and serves as the central control unit of a PON. It converts electrical signals into optical signals and manages communication with multiple ONUs or ONTs at the subscriber side, controlling bandwidth allocation and data flow .
- **Optical Distribution Network (ODN)** The ODN is the passive fiber infrastructure that links the OLT to the optical distribution box. It typically consists of:
  - Main fiber cables running from the OLT to a Fiber Distribution Hub (FDH) or directly to the distribution box.
  - Optical splitters that divide a single fiber signal into multiple paths to serve several end users efficiently .
- **Fiber Distribution Hub (FDH) / Optical Distribution Box (ODB)** The optical distribution box, sometimes called a Fiber Distribution Box (FDB), acts as an intermediate point where the main fiber from the OLT is split and distributed to individual drop fibers. It provides:
  - Signal distribution to multiple subscriber lines.
  - Protection and management of fiber connections, including splicing and patching interfaces....
