

Core switch stack cannot be switched

Overview

This guide explains the symptoms, common causes, Cisco CLI checks, and a verification workflow. basically after you have configured the stack, you can manage it as if it were a single device, as you can read from the document, both devices are responsible for traffic forwarding (Data Plane), but only the Master switch manages the control plane You can configure the stack as L2 or L3 device. We're going to install two 48 port SFP+ switches at a co-location facility that will house all of our primary servers and storage. Our provider will add our 10 gig ring to our rack and normally they handoff one 10gig fiber to us. The only thing plugged into the switch are the uplinks to the core. They require a strategy to prevent this sort of disruption from occurring again.
