

Distance between cable tray and heating pipe

AI Overview

Maintain at least 0.5 meters from insulated heating pipes and 1 meter from uninsulated heating pipes for safe cable tray installation.

Recommended Safety Distances

- Insulated thermal pipes: Cable trays should be installed at a minimum distance of 0.5 meters parallel to the pipes to prevent heat damage to the cables and allow safe maintenance access (Apex Tray) .
- Uninsulated thermal pipes: A minimum distance of 1 meter is recommended, with additional heat protection measures for the cables if necessary .
- Cable trays above heating pipes: Avoid placing trays directly above thermal pipes. If unavoidable, maintain at least 1 meter of vertical clearance and ensure proper insulation is installed to protect the cables from heat .
- Process or non-thermal pipes: For common process pipes, such as compressed air lines, a minimum distance of 0.4 meters is suggested .

Additional Considerations

- Mechanical protection: If cables are mechanically protected, smaller clearances may be acceptable, but standard practice is to maintain the recommended distances to prevent heat and mechanical damage .
- Corrosive pipes: When pipes carry corrosive liquids or gases, maintain at least 0.5 meters and apply anti-corrosion measures or use corrosion-resistant materials for t...
