

Distribution Box Room Sorting

Overview

Sortation systems increase the efficiency of processes, and the productivity of operators. By using automation to sort and divert goods to the proper picking zones, a facility can minimize the number of touches each item sees, shortening cycle time and reducing the chance for error. Manual or outdated sorting methods simply cannot keep up, leading to errors, delays, and dissatisfied customers. By replacing manual, error-prone processes with high-speed, intelligent technology, you can dramatically improve efficiency. The Numina Group is a warehouse automation specialist and highly experienced in selecting, configuring, integrating, and installing automated sortation systems. Whether you're a warehouse manager facing rising volumes or an eCommerce director pushing for faster shipping times. Sortation systems automate product routing and diverting to support high-volume operations and faster order processing. Sortation equipment often uses task-specific algorithms and codes to identify what these items are. Sortation is the process of organizing and separating items or packages based on specific criteria or destinations.
