

Distribution box circuit breaker model

AI Overview

Distribution boxes typically use molded case circuit breakers (MCCBs) or miniature circuit breakers (MCBs), with ratings depending on the application, such as a 1000A MCCB for high-current systems.

Common Types of Circuit Breakers

Molded Case Circuit Breakers (MCCBs) are widely used in main distribution boxes and power distribution cabinets, especially in industrial or commercial settings. A 1000A MCCB is designed to handle high currents up to 1000 amperes and provides both overload protection via a bimetallic strip and short-circuit protection through an electromagnetic trip unit. These breakers can safely interrupt fault currents up to tens of kiloamperes, such as 65kA, ensuring protection for both equipment and upstream power systems. Miniature Circuit Breakers (MCBs) are more common in residential or small commercial distribution boxes. They protect individual branch circuits from overloads and short circuits, typically rated for currents from 6A to 125A. MCBs are compact, easy to install, and provide reliable protection for lighting, outlets, and small appliances.

Components of a Distribution Box

A distribution box, also called a DB box or breaker panel, houses several key components:

- Main breaker: Controls the entire electrical supply to the building and can be an MCCB for high-current systems or an MCB for smaller installations
