

Distribution box equipped with leakage protection

AI Overview

Modern distribution boxes are equipped with leakage protection devices to prevent electric shock and fire hazards.

Function of Leakage Protection

A distribution box with leakage protection includes devices such as residual current devices (RCDs), leakage circuit breakers, or leakage protectors, which automatically disconnect the circuit or trigger an alarm when leakage current exceeds a predetermined threshold . This ensures the safety of users and protects electrical equipment from potential hazards caused by earth leakage currents .

Installation and Standards

Leakage protection devices are typically installed on the power supply side of the distribution panel or inside the panel itself. The incoming line connects to the side marked as "power supply," and the outgoing line connects to the "load" side . Installation must follow proper orientation and wiring to ensure correct operation, and devices are often mounted vertically or horizontally depending on the model .

The rated leakage action parameters vary depending on the application:

- Main distribution box: 50-100 mA, action time >0.1 s
- Switch box: ≤ 30 mA, action time
