

Distribution box panel with 10 circuits

AI Overview

A 10-circuit distribution box panel safely distributes electrical power to ten separate circuits, each protected by its own fuse or breaker.

Overview

A distribution box panel (also called a distribution board, panelboard, or DB box) is a central hub that receives incoming power from a main supply and distributes it to multiple branch circuits. A 10-circuit panel specifically allows ten individual circuits, each with its own protective device, to operate independently, improving safety and organization in electrical systems .

Key Components

- Busbars: Conduct and distribute power from the main input to each circuit .
- Circuit breakers or fuses: Protect each circuit from overloads or short circuits. In a 10-circuit panel, there are ten breakers or fuses .
- Residual Current Devices (RCDs) or RCBOs: Optional devices that detect leakage currents and prevent electric shocks .
- Enclosure: Typically made of thermoplastics like polycarbonate or metal, providing a safe, insulated housing for all components .
- Switches/isolators: Allow circuits to be turned off for maintenance or emergencies .
- Surge protection devices (SPD): Optional, protect connected equipment from voltage spikes .
