

Do cable trays need to use galvanized supports

AI Overview

Cable tray supports do not always have to be galvanized, but galvanization is strongly recommended in most environments to prevent corrosion and ensure long-term durability.

Material Considerations for Cable Tray Supports

Cable tray supports are typically made from steel or stainless steel, and their material selection depends on the environment in which they are installed . Galvanization, either pre-galvanized (electro-galvanized) or hot-dip galvanized, provides a protective zinc layer that prevents steel from rusting. The zinc acts as a sacrificial layer, corroding first while protecting the underlying steel, and forms a stable oxide layer that resists further corrosion .

When Galvanized Supports Are Recommended

- Indoor, dry environments: Galvanization may not be strictly necessary if the steel is protected from moisture, but it is still often used as a precaution .
- Outdoor or humid environments: Galvanized supports are strongly recommended to prevent rust and structural degradation .
- Industrial or corrosive environments: Areas exposed to chemicals, oils, or construction materials benefit from galvanized or stainless steel supports to maintain integrity over time
