

Does the optical module need to be identical at both ends

Overview

Therefore, the optical transceivers should support an identical wavelength at both ends in order to realize the process. 1, Same wavelength In a fiber optic link, data is transmitted from one end to the other, and the optical module is responsible. The SFP converts electrical signals from one end to optical signals, transmits them through fiber, and converts them back to electrical signals at the other end during transceiver transmission. If you're having. A BiDi SFP module is a bidirectional fiber optic transceiver that enables simultaneous transmit and receive over a single strand of single-mode fiber, instead of the traditional two-fiber setup. They even have the same performance levels, and so the customer does not lose out at all. Moreover, branded SFP products are much more expensive than their compatible counterparts. This chapter presents the BiDi SFP optical.
