

# Fiber Optic Cable Fusion Connection Sequence

## AI Overview

The fusion splicing sequence involves preparation, stripping and cleaning, precise cleaving, alignment, fusion, and protective finishing to ensure a reliable optical connection.

### 1. Preparation

Before starting, gather all necessary tools and materials: a fusion splicer, fiber optic cables, protective sleeves or heat shrink tubes, alcohol wipes or cleaning solution, and a precision cleaver. Inspect each fiber for damage and cut cables to equal lengths to maintain consistency during splicing. Ensure the work area is clean and free of dust or contaminants to prevent splice degradation .

### 2. Stripping and Cleaning

Remove the protective coating from each fiber using a precision stripping tool, taking care not to damage the glass core. Typical strip lengths range from 10–20 mm depending on the splicer specifications. After stripping, clean the exposed fiber with isopropyl alcohol to remove dust, oils, or debris. Proper cleaning is critical, as even microscopic contamination can increase splice loss .

### 3. Cleaving

Use a fiber cleaver to create a flat, perpendicular end face on each fiber. The cleave...
