

Fiber Optic Cold Splice Installation Tools

AI Overview

Fiber optic cold splice installation requires specialized hand tools for precise fiber preparation, cleaving, and mechanical splicing, often organized in professional tool kits for field use.

Key Tools for Cold Splicing

1. Fiber Strippers: Used to remove the outer jacket, buffer, and coating from the fiber without damaging the glass core, ensuring proper exposure for splicing . 2. Fiber Cleavers: Precision cleavers create a flat, 90-degree end-face on the fiber, which is critical for low-loss mechanical splices. Even a slight angle deviation can cause high insertion loss . 3. Kevlar Scissors and Jacket Cutters: These cut the strength members (like Kevlar) and outer jackets cleanly, preparing the fiber for splicing . 4. Mechanical Splice Holders: Devices that align and hold fibers in place for cold splicing, allowing the fibers to be joined without heat . 5. Visual Fault Locators (VFL) and Optical Power Meters: Used to verify continuity and measure signal loss after splicing, ensuring the splice is properly aligned and functional . 6. Cleaning Tools: Lint-free wipes, alcohol, and specialized brushes remove contamination from fiber ends, which is a leading cause of splice failure .

Tool Kits and Features

Professional fiber optic tool kits often combine all necessary instruments for cold splicing in a single, rugged case. Typical features include:

- Comprehensive Kits: Include fiber strippers, cleavers, Kevlar scissors, jacket stripp...
