

Fiber optic interface of cable TV router

AI Overview

Fiber optic routers designed for cable TV networks must support high-speed Gigabit connections, WAN ports for ONTs, and advanced wireless standards like Wi-Fi 6 or 7.

Key Features of Fiber-Ready Routers

- **High-Speed Capability:** Routers must support at least Gigabit Ethernet (1000 Mbps) to handle the bandwidth provided by fiber connections, ensuring smooth streaming and IPTV delivery . Multi-gigabit routers can support speeds up to 5 Gbps, ideal for high-definition cable TV and multiple simultaneous users .
- **WAN Port for ONT:** Fiber networks often require an Optical Network Terminal (ONT) to convert light signals into data. A fiber-ready router should have a dedicated WAN port to connect to the ONT, or in some cases, a built-in optical interface .
- **Advanced Wireless Technology:** Modern routers include Wi-Fi 6 or Wi-Fi 7, providing faster wireless speeds, lower latency, and better coverage for streaming cable TV content across multiple devices .
- **Multiple LAN Ports and Aggregation:** Routers with multiple Gigabit LAN ports allow wired connections to smart TVs, set-top boxes, or media servers. Some routers support LAN port aggregation, combining ports for higher throughput, which is beneficial for high-bandwidth cable TV applications .
- **Mesh and Outdoor Options:** For larger homes or office setups, mesh routers or outdoor-rated fiber routers can extend coverage and maintain stable connections for IPTV or streaming services .
