

Fiber optic routers and fiber optic splitter boxes

AI Overview

Fiber optic routers manage network traffic, while fiber optic splitter boxes divide or distribute optical signals to multiple endpoints in a fiber network.

Fiber Optic Routers

Fiber optic routers, often part of an Optical Network Terminal (ONT) or Optical Line Terminal (OLT) setup, are active devices that manage data traffic over fiber networks. They convert optical signals into electrical signals for devices, handle bandwidth allocation, user authentication, and support multiple users simultaneously. In FTTH networks, routers are typically installed at the subscriber's premises or central office to ensure high-speed internet access and reliable connectivity.

Fiber Optic Splitter Boxes

A fiber optic splitter box is a passive optical component that divides a single incoming optical signal into multiple outgoing signals, or combines multiple signals into one . Unlike routers, splitters do not require power and rely on light physics to distribute signals efficiently. They are essential in Passive Optical Networks (PONs), allowing a single fiber from the provider to serve multiple homes or devices. Splitters come in various ratios, such as 1:2, 1:16, or 1:32, depending on the number of endpoints .
