

Fiber optic terminal box connection flange

AI Overview

A fiber optic terminal box connection flange is the interface adapter that allows optical fibers to connect securely to a termination box, supporting SC, FC, ST, or LC connectors.

Overview

A fiber optic terminal box (also called a fiber optic termination box or OTB) is used to terminate, protect, and manage optical fiber cables in indoor or outdoor networks. It provides a secure location for splicing, patching, and storing excess fiber while maintaining proper bend radius and strain relief for the cables . The connection flange (also referred to as a fiber optic coupler or adapter) is installed on the terminal box to interface the incoming fiber cables with patch cords or pigtails. It ensures precise alignment of fiber cores, minimizing signal loss and maintaining network performance .

Types of Flanges/Adapters

The most common types of flanges used in fiber optic terminal boxes include:

- SC (Subscriber Connector): Square-shaped, push-pull design, widely used in FTTH and LAN applications .
- FC (Ferrule Connector): Screw-on type, providing high stability, often used in high-vibration environments
