

Fireproofing and sealing material content of cable trays

AI Overview

Fireproofing and sealing of cable trays typically use fire-rated boards, firestop packs, firestop mastic, mineral wool, and specialized fire-resistant coatings.

Fire-Resistant Coatings

Cable trays are often coated with intumescent or fire-resistant coatings such as FLAMMOTECT-A or DG-CR 0.7, which form a protective shield around cables to prevent flame propagation and maintain functionality during a fire. These coatings also enhance resistance to environmental factors like UV radiation, moisture, oil, and chemicals, making them suitable for both indoor and outdoor applications . Application methods include spraying, rolling, or brushing, with careful control of thickness to meet fire-resistance standards .

Firestop Materials

For sealing cable trays, especially at wall or floor penetrations, firestop packs, firestop mastic, and fire-resistant mineral wool are commonly used. Firestop packs are placed in an orderly sequence, ensuring gaps between cables and packs do not exceed 1 cm², with a minimum packing thickness of 24 cm. Firestop mastic is applied to seal gaps and ensure airtight, fire-resistant closures, while mineral wool provides thermal insulation and flame resistance .
