

Ghana Hot Aisle Rack-Mounted Type

AI Overview

Hot aisle containment (HAC) systems optimize data center cooling by isolating hot exhaust air from server racks, improving airflow management and energy efficiency.

Overview

Hot aisle containment systems are designed to capture and channel hot air generated by IT equipment into a dedicated plenum, preventing it from mixing with cold air and enhancing cooling efficiency in data centers. These systems are particularly useful in high-density rack environments, such as those found in modern data centers in Ghana, where energy costs and cooling efficiency are critical.

Types of Hot Aisle Containment

- Ceiling-Suspended Hot Aisle Containment (HAC)
 - Suspended from the ceiling above server racks, creating an overhead plenum for hot air return.
 - Features pre-assembled frames with slide-locks for easy installation, airtight gaskets, and customizable doors in clear or multiwall polycarbonate.
 - Supports hybrid cooling setups, including air and liquid cooling, and can be adapted to any data center layout.
- Floor-Mounted Hot Aisle Containment
 - Encloses the hot aisle at floor level with end-of-row doors and ceiling panels.
 - Provides structural support for IT services on adjustable cantilevered arms.
 - Suitable for air, liquid, or hybrid-cooled environments and allows for quick installation without major modifications to existing infrastructure....
