

Home electrical distribution box connection method

AI Overview

Home electrical distribution boxes connect incoming power to multiple circuits using phase, neutral, and ground terminals, with protective devices like MCBs and RCCBs ensuring safety.

Key Connection Methods

1. Input Connections: The main power supply enters the distribution box through a main MCB or isolator switch. For single-phase systems, this includes a phase (live) wire and a neutral wire, while three-phase systems include three phase wires and a neutral. The input wires are connected to the main MCB, which acts as the primary switch for the entire panel (). 2. Protective Device Connections:

- MCBs (Miniature Circuit Breakers): Single-pole MCBs are used for individual circuits, while double-pole MCBs may be used for high-power appliances or as the main switch.
 - RCCBs (Residual Current Circuit Breakers): These are connected downstream of the main MCB to detect leakage currents and protect against electric shocks. The output of the main MCB is connected to the RCCB input, and the RCCB output feeds the individual circuit MCBs ().
3. Busbar and Terminal Connections:
- Phase Busbar: Distributes the live wire to all MCBs.
 - Neutral Busbar: Connects all neutral wires from the circuits.
 - Earth Busbar: Connects the grounding wires from circuits and the metallic body of the panel to the earth pit. Wires are stripped to the correct length, crimped or scre...
