

How fast should optical cable stripping be performed

AI Overview

Optical fiber coatings can be stripped in as little as 5–8 seconds per fiber using modern automated or heated handheld strippers.

Manual and Handheld Stripping

Manual fiber strippers are precision tools designed to remove coatings from optical fibers without damaging the glass core. Typical coated fibers have a 125 μm glass diameter with coatings around 250 μm . Stripping a standard 30–40 mm length manually can take several seconds per fiber, depending on the operator's skill and the type of coating (acrylate, silicone, or polyimide) being removed. Handheld battery-powered strippers with integrated heating elements, such as AFL's Precision Strip, can strip 900 μm coated fibers in 5–8 seconds, requiring minimal force and reducing the risk of fiber damage.

Semi-Automated and Automated Stripping

Semi-automatic machines, like Komax FiberOptic 7010 or FiberStrip 7030, are designed for high repeatability and efficiency. These systems can handle fibers with coatings from 125/250 μm up to 125/900 μm and strip lengths ranging from 3 mm to 60 mm. Automated systems are particularly useful in production environments, where multiple fibers need to be stripped quickly and consistently, significantly increasing throughput compared to manual methods....
