

How large should the flat steel bar for repeated grounding in the distribution box be

Overview

Flat steel bars should be installed at least 750 mm or 30 inches underground. Abrasive mechanical connections along with UL lugs or exothermic welds should be made to the bars. 52 (A) (7) identifies flat steel bars as grounding electrodes if low carbon steel bars are placed in a horizontal. (1) One or more electrically conductive steel reinforcing bars (rebar) of at least $\frac{1}{2}$ in. (2) A bare copper conductor at least 4 AWG and at least 20 ft long can. A premise's wiring system supplied by a grounded service must have a grounding electrode conductor (GEC) connected to the service neutral conductor per Sec. 24 (A) (1) through (4): (1) General. When a sub panel is installed in a separate structure, such as a detached garage, the structure must have its own. Section 250. This section also adds requirements, conditions, and restrictions to such installations. Rod, pipe, and plate grounding.
