

How long is a single cable in a mesh cable tray

AI Overview

A standard single mesh cable tray typically comes in lengths of 10 feet (3 meters) per section, though variations from 8 to 12 feet are common depending on manufacturer and project requirements.

Standard Lengths and Installation

Wire mesh cable trays, also known as basket trays, are generally manufactured in 10-foot (3-meter) sections, which allows for easy handling, transport, and installation. Some manufacturers may offer shorter sections, such as 8 feet, for tighter spaces or easier routing, and longer sections up to 12 feet for long, uninterrupted runs. These lengths are designed to be modular, so multiple sections can be joined using couplers to achieve the desired total run.

Span and Support Considerations

The support spacing for a single mesh tray is critical for maintaining structural integrity and preventing excessive deflection. Standard recommendations suggest supports every 8 feet (2.4 meters) for typical cable loads, though heavier cables may require shorter spans. Couplers should be positioned at approximately 1/5th of the span to maximize mechanical performance, and supports should be placed at bends or changes in elevation to prevent sagging.
