

How to check fiber optic cable on a router

AI Overview

Fiber optic cables connect to your router via an Optical Network Terminal (ONT), and you can verify the connection by inspecting the ONT, router ports, and testing the fiber link.

Identify the Fiber Setup

Most home fiber connections do not plug directly into a standard router. Instead, the fiber line terminates at an Optical Network Terminal (ONT), which converts the optical signal into an electrical signal your router can use. To check if your router is connected to fiber:

- Locate the ONT near where the fiber enters your home, often on a wall or in a closet.
- Look for a fiber optic cable (usually thin, yellow, with SC/APC or SC/UPC connectors) plugged into the ONT's optical port.
- Check that an Ethernet cable runs from the ONT's LAN or Ethernet output port to the router's WAN or Internet port.

Verify Router and ONT Status

- Power light on the ONT should be solid green.
- PON or Optical light indicates the fiber link status: solid green/blue means active, flashing indicates connection attempts, and red or off signals a problem.
- On the router, the WAN/Internet indicator should show connectivity, confirming the ONT-to-router link is functional
