

How to connect fiber optic cables through corrugated conduit

AI Overview

Fiber optic cables can be safely installed through corrugated conduit by using innerducts, proper lubrication, tension control, and careful handling to prevent damage to the fibers.

Preparation and Conduit Selection

Before installation, ensure the conduit is clean, free of debris, and appropriately sized for the fiber cable and any innerducts. Corrugated conduit is often used for flexibility and protection, and it can accommodate multiple innerducts for future cable expansion. Innerducts, which can be ribbed, corrugated, or smooth-walled, provide a low-friction path and additional mechanical protection for the fiber. Calculate the fill ratio to avoid excessive tension; a lower fill ratio reduces pulling stress on the cable.

Cable Handling and Pulling

Attach the fiber cable to a pull string using a swivel pulling eye to prevent twisting, and ensure the pulling force is applied only to the cable's internal strength members, not the outer jacket or glass fibers. Use a manufacturer-approved, water-based lubricant compatible with the cable jacket to reduce friction, especially in long runs or multiple bends. Avoid petroleum-based lubricants or detergents, as they can damage polyethylene sheaths.
