

How to connect the FFU distribution box

AI Overview

Connecting an FFU distribution box involves properly wiring the power inlet, connecting the network or fieldbus interfaces, and ensuring correct termination and safety compliance.

Power Connection

FFU units typically feature a flush-mounted junction box on the top of the unit for power input. You have several options depending on your installation:

- AMP Connector: Use the AMP receptacle (p/n 206061-1) for a secure pin connection.
- IEC Connector: A male IEC connector can be used for standard AC power input.
- 6-Foot Power Cord: Some units come with a pre-attached cord for direct connection.
- Harting Connector: For rugged installations, a Harting connector allows locking the power inlet securely . Ensure the power source matches the FFU voltage and current specifications, and always follow local electrical codes.

Network and Control Connections

If your FFU supports network integration:

- Ethernet Connection: Connect an Ethernet cable to RJ45 ports (P4 or P5). The FFU card embeds a web server accessible via a browser at <http://ffu> on port 80. TCP Modbus communication is available on port 502 for control and monitoring .
- Alarm and Status Signals: FFU cards send multicast alarms to all connected units. Each card listens on port 239.0.0.51:5140, and alarms reset automatically after 15...
