

How to convert a router to a fiber optic connector

AI Overview

A standard router cannot be directly converted to accept a fiber optic cable; instead, an Optical Network Terminal (ONT) or a fiber-ready router is required to interface with fiber connections.

Why Standard Routers Cannot Accept Fiber Directly

Standard home routers have Ethernet ports designed for electrical signals over copper cables, while fiber optic cables transmit data as pulses of light through glass or plastic strands. These two signal types are fundamentally incompatible, so a fiber cable cannot plug directly into a typical router port. Attempting to modify a standard router to accept fiber directly is not practical due to differences in signal conversion, connector types, and power requirements.

How Fiber Internet Connects to a Router

Fiber internet setups use an Optical Network Terminal (ONT), which is usually provided by the ISP. The ONT converts the incoming light-based fiber signal into a standard Ethernet signal that your router can understand. The connection process typically involves:

- **Fiber Cable to ONT:** The fiber cable terminates at the ONT using a compatible connector (e.g., SC, LC, or ST). The ONT handles optoelectronic conversion.
- **ONT to Router:** A standard Ethernet cable connects the ONT's Ethernet output to the router's WAN port, allowing the router to distribute internet throughout your ho...
