How to expand the capacity of a mobile optical splitter

Overview

When used strategically, optical splitters enable service providers to expand coverage, reduce fiber usage, and simplify network operations. By dividing a single optical signal from a central Optical Line Terminal (OLT) into multiple outputs for Optical Network Terminals (ONTs) at users' homes, splitters eliminate the need for dedicated fibers to each residence—slashing infrastructure costs while scaling network reach. This guide. How to increase the utilization of Combo Ports to access more subscribers without affecting the network bandwidth rate is a worthy reference for Internet Service Providers and Telecom Operators and a way to reduce operating costs. Our PON solutions are made to solve common challenges like capacity limitations and limited rack space. A key challenge is determining how many users a single OLT port can support, which is defined by the split ratio.
