

How to remove the fiber optic array module

AI Overview

To safely remove a fiber optic array module, first disconnect the fiber cables, release the module latch, and remove the module in a straight motion while using ESD protection.

Step-by-Step Removal Procedure

- Power and Port Preparation
 - For most modern switches, you do not need to power off the device because SFP, SFP+, and QSFP modules are hot-swappable, but it is recommended to disable the port in software if possible to prevent network disruption .
- Disconnect Fiber Cables
 - Carefully unplug all fiber optic cables from the module. Avoid bending or twisting the fibers, and always use dust caps to protect the connectors .
- Release the Module Latch
 - Identify the latching mechanism (pull tab, bale-clasp, slide tab, or actuator button) and gently press or pull the latch to release the module .
- Remove the Module
 - Pull the module straight out of the port without twisting or angling it. If the module feels stuck, use a gentle rocking motion or tweezers on the pull ring, but never force it
