

How to use the coupler on the fiber optic terminal box

AI Overview

The coupler in a fiber optic terminal box is used to connect pigtails to patch cables, enabling secure and efficient fiber optic signal transmission.

Understanding the Coupler

A fiber optic coupler (also called an adapter) is a small device inside the terminal box that allows two optical fibers to be joined without splicing. It connects the pigtail (a short fiber with a connector) to a fiber patch cable, ensuring proper alignment and minimal signal loss. The coupler typically supports standard interfaces such as SC, FC, or LC.

Step-by-Step Usage

- Prepare the Terminal Box
- Open the fiber optic terminal box and ensure the internal splice tray or cassette is accessible.
- Secure the incoming fiber optic cable in the designated slot to prevent movement.
- Splice the Pigtail
- Strip the incoming fiber cable to expose the core.
- Fusion splice the fiber core to the pigtail inside the terminal box. The pigtail will have a connector on its free end.
- Insert the Pigtail into the Coupler...
