

How to use the fiber optic five-core terminal box

AI Overview

A fiber optic five-core terminal box is used to terminate, splice, and manage fiber optic cables, connecting them securely to pigtails and ensuring organized distribution.

Step-by-Step Usage Guide

1. Prepare the Installation Site Choose a suitable location for the terminal box, ensuring it is easily accessible and aligns with network requirements. Wall-mounted or rack-mounted options are common depending on the environment (). Ensure the area is clean and free from dust or moisture.
2. Open the Terminal Box and Prepare Tools Open the fiber optic terminal box and gather all necessary tools and accessories, including cable strippers, fusion splicer, splice sleeves, and connectors (). Measure the required cable length to allow sufficient buffer inside the box.
3. Prepare the Fiber Cable Strip the outer jacket of the fiber cable to expose the individual fibers, leaving at least 0.5 meters of fiber for easy handling and coiling (). Carefully remove the strength members and clean the fibers to prevent contamination.
4. Route the Cable into the Box Pass the stripped cable through the designated entry point, usually at the top or bottom of the splice tray. Secure the cable's strength member using the provided fixing parts to stabilize the cable inside the box ().
5. Splice Fibers to Pigtails Coil the prepared fibers neatly in the splice tray. Use a fusion splicer to connect each fiber to its corresponding pigtail. Place the splice in protective sleeves and secure them in the tray to prevent movement or damage ().
6. Connect Pigtails to Connectors Attach the spliced pigtails to the appr...
