

# Industrial Switch Network Configuration

## AI Overview

Configuring an industrial network switch involves hardware setup, initial IP configuration, VLAN and routing setup, security measures, and monitoring to ensure reliable industrial network performance.

### Hardware Setup

- **Mounting the Switch:** For DIN-rail switches, attach the mounting clips and slide the switch onto the rail; for rack-mount switches, secure the switch using brackets and screws in a well-ventilated location with power access .
- **Power and Grounding:** Connect the switch to the appropriate DC or AC power source and ensure proper grounding to prevent electrical hazards .
- **Connecting to a Computer:** Use a straight-through or crossover Ethernet cable to connect your computer to the management port or console port of the switch .

### Initial Configuration

- **Express Setup / Management Access:** Use the switch's Express Setup or management software to assign a static IP address, subnet mask, and optionally a default gateway. Ensure the computer and switch are in the same subnet during setup .
- **Admin Account:** Create a secure admin username and password, following recommended complexity rules (8–31 characters, including uppercase, lowercase, numbers, and symbols), .
- **Firmware Update:** Verify the firmware version and update if necessary to ensure compatibility and security .
