

Install horizontal cables in distribution box

AI Overview

Horizontal cables should be installed from the telecommunications room to the distribution box using proper cable management, connectors, and adherence to standards to ensure safety and performance.

Preparation and Planning

Before installation, survey the installation site to determine the optimal location for the distribution box. Ensure the area is dry, ventilated, and free from flammable or corrosive materials. Select the appropriate distribution box size and model based on the number of circuits and expected cable load, and gather necessary tools such as screwdrivers, wire strippers, multimeters, and insulation testers .

Cable Selection and Routing

Horizontal cabling typically consists of twisted-pair copper cables (Cat5e, Cat6, Cat6a) or fiber optic cables, depending on speed and distance requirements . The cabling should follow a home-run, star topology from the telecommunications room to the distribution box, with a maximum horizontal distance of 76 meters (250 ft) . Use cable trays or conduits to route cables, maintaining a maximum fill ratio of 40% and ensuring proper clearance above and below the trays . Avoid attaching cables directly to pipes, conduits, or ceiling tiles.
