

Installation of complete distribution box and distribution frame

AI Overview

Installing a complete distribution box frame involves proper site selection, secure frame fixing, precise wiring, grounding, and thorough testing to ensure safety and reliability.

Site Selection and Preparation

Choose a dry, well-ventilated, and accessible location close to the main power supply to minimize power loss and facilitate maintenance (). Avoid areas with high humidity, corrosive substances, or flammable materials. The installation height is typically 1.5 to 1.8 meters above the ground for convenient operation and inspection ().

Frame Fixing

- **Iron Frame Installation:** Straighten the angle steel, measure dimensions, mark cutting lines, bend and cut the steel, drill holes, and weld the frame. Ensure joints are aligned and the embedded ends are dovetail-shaped. Apply anti-rust paint after rust removal ().
- **Bolt Fixing:** Use metal expansion bolts to secure the frame directly to the wall. Determine fixing points using string positioning, drill vertical holes matching bolt sleeves, and insert bolts snugly ().
- **Recessed Boxes:** For recessed installations, fix and level the box, fill edges with cement mortar, and ensure the surface is flat and gaps are evenly filled ().
