

Is a VLAN typically configured on a core switch or an aggregation switch

Overview

Best practice is to create VLANs on the core switch (if it's Layer 3 capable) so inter-VLAN traffic is handled at line speed, and only internet/WAN traffic goes through the Peplink. For example, if your core is L2, then likely you'll need your new voice VLAN there too. 10-03-2022 10:08 AM I agree with Joseph that we do not understand your. I have learned to configure the vlan interfaces on the core switch- and then configure the access switch with the desired vlan and assign the switch port to that vlan! If I use this design and then allow only (1) one vlan per floor. 01 | First, Let's Clarify: What Is a. A VLAN is a group of end stations with common requirements regardless of their physical location. VLANs have the same attributes as physical local area networks, but end stations can be grouped even if they are physical local area networks. Not physically on the same LAN segment. VLANs are. Should the VLANs be created and configured on the core switch, or directly on the Peplink 3?

Which approach is considered best practice, and why?

Thanks in advance for your advice! Either is fine, but whatever you choose, that needs to be the one and only place you manage them from or add new ones. Master VLAN implementation with best practices and real-world examples Virtual Local Area Networks (VLANs) provide logical network segmentation, improving security, performance, and management flexibility. Cannot be deleted but should not be used for production traffic.
