

Kenya DTU Distribution Automation Terminal

AI Overview

DTU Distribution Automation Terminals are intelligent devices that enable real-time monitoring, control, and automation of power distribution networks, enhancing reliability and efficiency.

Overview

A Distribution Terminal Unit (DTU) is a smart grid device designed for protection, monitoring, and control of distribution networks, including ring main units, small switch stations, and feeder lines . In Kenya, DTUs are increasingly relevant as utilities modernize the grid to improve reliability, integrate renewable energy, and reduce outage durations.

Key Features

- **Multi-Input Measurement:** DTUs can measure multiple three-phase AC voltages and currents, frequency, power, and power factor. They can also handle direct current inputs, with flexible configuration options .
- **Fault Detection and Automation:** The device automatically identifies feeder power failures, records load data at the time of outages, isolates permanent fault sections, and restores power to unaffected areas .
- **Control and Communication:** Equipped with RS232, RS485, and 10/100M Ethernet ports, DTUs communicate with sub-stations and other intelligent devices. They support multiple protocols such as IEC 61850, DNP3, Modbus, and 101/104 for SCA...
