

Korea Single-Fiber Bidirectional SFP

AI Overview

Single-Fiber Bidirectional SFP (BiDi SFP) modules enable full-duplex communication over a single optical fiber, reducing fiber usage by up to 50% while maintaining high-speed data transmission.

What is a BiDi SFP?

A BiDi SFP (Bidirectional Small Form-Factor Pluggable) is an optical transceiver that allows simultaneous transmission and reception of data over a single fiber strand using Wavelength Division Multiplexing (WDM) technology . Unlike standard duplex SFPs, which require two fibers—one for transmitting (TX) and one for receiving (RX)—BiDi modules use two different wavelengths on the same fiber to carry data in both directions. Common wavelength pairs include 1310 nm/1490 nm or 1310 nm/1550 nm, with one end transmitting at one wavelength and receiving at the other, and the opposite at the paired module .

How BiDi SFP Works

Inside the BiDi module, a WDM filter separates the incoming and outgoing signals, preventing interference and maintaining data integrity . This is similar to a two-way radio conversation where each frequency carries a different direction of communication. The module is full-duplex, meaning it can send and receive data simultaneously over a single fiber, effectively doubling the capacity of existing fiber infrastructure without additional cabling .
