

Laser Diode Laser Head

AI Overview

A laser diode is the semiconductor source that generates coherent light, while a laser head is the assembly that houses the laser source and optics to direct, focus, or process the beam.

Laser Diode

A laser diode (LD) is a semiconductor device that emits coherent light when electrically pumped. It operates similarly to a light-emitting diode but produces stimulated emission, generating light with a specific wavelength, phase, and coherence. The wavelength depends on the semiconductor material and can range from ultraviolet (UV) to infrared (IR) spectra. Laser diodes are widely used in fiber-optic communications, barcode scanners, laser pointers, CD/DVD/Blu-ray devices, and scientific applications. They are compact, efficient, and can be operated in continuous-wave or pulsed modes, including picosecond pulses for high-precision experiments .

Laser Head

A laser head is an assembly that contains the laser source (which can be a diode, lamp, or other gain medium) along with optics, cooling systems, and sometimes additional components for beam shaping or delivery. In industrial or research applications, a laser head may include focusing lenses, protective windows, air nozzles, or fiber-coupled inputs to direct the laser beam to a workpiece or experimental target. Some laser heads, like those used in CNC engraving or laser cutting, do not contain the laser source itself but manage the beam delivery and processing, ensuring precision and safety
