

Layout of Level 3 Distribution Box

AI Overview

A Level 3 distribution box typically contains single-phase circuit breakers, is installed close to the load center, and distributes mains electricity (220V) to individual units or appliances.

Overview of Level 3 Distribution

The Level 3 distribution box, also known as a tertiary distribution box, is the final stage in the electrical distribution system before electricity reaches end users in a building or residential unit. It receives power from the secondary distribution box (Level 2) and converts it into mains voltage suitable for household or unit use, typically 220V single-phase. This box is designed for direct connection to electrical appliances and outlets and ensures safe, organized power delivery.

Equipment Inside a Level 3 Distribution Box

- Single-phase circuit breakers: Protect individual circuits from overload and short circuits.
- Residual current devices (RCDs) or leakage protectors: Provide protection against electric shock and leakage currents.
- Busbars and terminal blocks: Facilitate organized connection of incoming and outgoing wires.
- Optional surge protection devices (SPDs): Type 3 SPDs can be installed close to sensitive equipment to protect against voltage spikes.
