

Main incoming line to the household distribution box

AI Overview

The main incoming line to a household distribution box consists of two hot conductors from the utility, a neutral, and a grounding conductor, which connect to the main switch and bus bars to safely distribute electricity throughout the home.

Overview of the Main Incoming Line

The main incoming line, also called the service entrance, is the primary electrical feed from the utility to your home. It typically includes:

- Two hot wires (black and red in a split-phase system), each carrying 120V relative to neutral, providing 240V across both wires for high-power appliances.
- Neutral wire (white or gray), which completes the circuit and connects to the neutral bus bar.
- Grounding conductor (bare copper or green-insulated), which connects to the ground bus bar and external grounding electrodes for safety .

Connection to the Distribution Box

- Entry Point: The service entrance cable enters the distribution box through the top knockout, often via a 2-inch conduit from the weatherhead or meter box .
- Line Terminals: The two hot wires are connected to the line terminals of the main disconnect switch or main breaker, usually located at the top of the panel .
- Neutral and Ground: The neutral wire connects to the neutral bus bar, and the grounding conductor connects to the ground bus bar. In the main panel, the neutral...
