

No data transfer after power failure of aggregation switch

Overview

Some possible causes are that the adapters in the aggregation are set to different line speeds or duplex modes or that they are plugged into different switches. Verify the adapters' configuration. What should I do?

Do I have to re-adopt?

Power cycle through the controller. I am a bot, and this action was performed automatically. I added unifi touch phone about a month ago and it stayed connected only a few days and dropped off the network. I tried messing around with the vlans and settings for that port. A network switch failure can disrupt business operations by causing connectivity issues, packet loss, and downtime for connected devices. This will also make a best-effort determination of the status of the progress of LACP based on the LACPDUs received from the switch. The following status values are possible:. This document describes common LAN switch features and how to troubleshoot any LAN switching problems.
