

OTDR optical cable line test

AI Overview

OTDR testing evaluates fiber optic cable performance by sending light pulses through the fiber and analyzing reflections to locate faults, measure loss, and verify installation quality.

Overview of OTDR Testing

An Optical Time Domain Reflectometer (OTDR) is a diagnostic tool that injects high-powered light pulses into a fiber optic cable. As the light travels, it encounters events such as connectors, splices, bends, or breaks. These events cause reflections (Fresnel reflections) and backscattering, which the OTDR measures to determine the location, type, and magnitude of losses along the fiber link (). The primary goals of OTDR testing are to:

- Characterize insertion loss of the fiber link.
- Identify and locate splices, connectors, bends, and breaks.
- Verify fiber continuity and quality.
- Document results for network commissioning and maintenance ().

Required Equipment

- OTDR device suitable for the fiber type (singlemode: 1310/1550 nm, multimode: 850/1300 nm).
- Launch cable (also called a pulse suppressor) to eliminate the dead zone at the start of the fiber.
- Receive cable (optional) to measure loss at the far-end connector....
