

Pigtail connection

AI Overview

A pigtail connection is a short wire or cable with a connector on one end and a bare or stripped end on the other, used to link devices, repair circuits, or extend wiring safely and efficiently.

What is a Pigtail Connector?

A pigtail connector is a short length of wire or cable that has a pre-attached connector on one end and a bare, stripped, or unterminated end on the other . The bare end is designed to be spliced, soldered, crimped, or fused to another wire or conductor in the field. This design allows the most critical part of the connection—the factory-terminated connector—to be completed in a controlled environment, ensuring reliability and reducing installation errors .

Applications

- Automotive: Pigtail connectors are widely used to repair or replace damaged wiring harnesses, sensors, light sockets, and other electrical components without replacing the entire harness .
- Electrical Wiring: They allow multiple wires to connect to a single device terminal, such as outlets, switches, or fixtures, preventing overcrowding and maintaining circuit integrity .
- Fiber Optics: Fiber optic pigtails are fusion-spliced to field fibers inside splice trays, commonly used in telecom and data center networks .
