

Portuguese secondary distribution box

AI Overview

A Portuguese secondary distribution box is an electrical device that steps down medium voltage electricity to low voltage for safe delivery to consumers, managed by distribution system operators (DSOs).

Function and Role

In Portugal, electricity is transmitted over long distances at extra-high voltage (EHV) and then delivered to substations. Secondary distribution boxes are part of the distribution network that converts medium voltage (MV) to low voltage (LV) suitable for households, businesses, and small industries . These boxes typically contain transformers, circuit breakers, fuses, and metering equipment to ensure safe and reliable electricity delivery.

Regulatory Framework

Low-voltage electricity distribution in mainland Portugal is managed under municipal concessions, with most areas served by EDP Distribuição, which covers around 99.5% of customers . The operation, maintenance, and expansion of distribution networks, including secondary distribution boxes, are overseen by DSOs like E-REDES, which ensure safety, reliability, and compliance with national standards . The legal framework for distribution, including the awarding of concessions and technical requirements, is defined by Decree-Law 15/2022 and related regulations .
