

Prevent the pigtail from hanging vertically

Overview

If I had to put 14 wires into a 15-pin d-sub connector, I would stagger the locations of the pigtail joints such that they were located in groups of 3 or 4 with each group being about 1/2" apart. This keeps them from stacking up the diameter of the wire bundle immediately behind the. The most basic definition is that pigtail siphons are a type of siphon that is nothing more than a looped pipe, in this case in a spiral similar to a pigtail, hence its name, although sometimes it is also used the name lyre type siphon or just lyre. These siphons are installed in vapor pressure. Pressure gauge siphons are used to protect the pressure gauge from the effect of hot pressure media such as steam and also to reduce the effect of rapid pressure surges. These two connection types drive the functionality and speed of deployment for AnyLANTM and FlexNAPTM. System connectors are known to be clean or cleaned prior to connection. A dirty connector will cause attenuation and may damage the. A simple yet effective solution to this problem is to intentionally create a "low" spot in the impulse line where condensed steam (water) will accumulate and act as a liquid barrier to prevent hot steam from reaching the pressure instrument. Prysmian offers an extensive range of optical pigtails for use in FTTx, telecommunications, data communications and CATV applications. All pigtails are fully qualified to Telcordia GR326.
