

Primary Distribution Box Wiring Layout

AI Overview

A primary distribution box should be wired with the main MCB feeding an RCCB, which then distributes power to branch MCBs, with all neutrals and earths properly linked for safety and compliance.

Key Components and Connections

Main MCB (Double Pole): The incoming phase and neutral from the utility meter connect to the main MCB, which acts as the primary isolator for the entire system.

Typically, a 63A double-pole MCB is used for domestic single-phase installations .

RCCB (Residual Current Circuit Breaker): The output of the main MCB connects to the input of the RCCB. The RCCB protects against leakage currents, electrical shocks, and insulation faults. For single-phase domestic setups, a 30mA rated RCCB is standard .

Branch MCBs (Single or Double Pole): The output of the RCCB feeds the branch MCBs. Single-pole MCBs are used for standard lighting and socket circuits, while double-pole MCBs may be used for special loads requiring both phase and neutral disconnection .

Neutral and Earth Links: All neutral wires from branch circuits connect to a neutral busbar, which is linked to the RCCB neutral output. All earth wires connect to an earth busbar, which is bonded to the main earth electrode for proper grounding .

Busbars: Copper busbars distribute power efficiently from the main MCB/RCCB to the branch MCBs, ensuring stable voltage and current flow .

Wiring Sequence

- Connect the incoming phase and neutral to the main double-pole MCB.
- Connect the output of the main MCB to the input terminals of the RCCB.
- Connect the RCCB output to the common busbar feeding all branch MCBs....
