

Principles of Fiber Optic Wavelength Division Multiplexing Technology

Overview

Wavelength division multiplexing (WDM) is a technique of multiplexing multiple optical carrier signals through a single optical fiber channel by varying the wavelengths of laser lights. WDM allows communication in both the directions in the fiber cable. This technique enables bidirectional communications over a. With the software RP Fiber Power one can simulate how channel powers evolve in a system, how cross-talk arises from nonlinear interactions, etc. Selection criteria, tradeoffs, and 73 suppliers - including: Find more supplier details at the end of the Encyclopedia article. The "basie" transmission rate of SONET is 64 kbps for supporting voice communications. SONET multiplexes large numbers of 64-kbps channels onto higher-rate datastreams. It can perform additional roles like providing redundancy, supporting advanced topologies, reducing hardware and cost, etc.
