

Removal of Huawei optical cable

AI Overview

To safely remove Huawei optical cables, carefully disconnect the fibers from the module, handle connectors gently, and store them with protective caps to prevent damage.

Step-by-Step Guide

1. Power Down and Prepare Before handling any optical cables, turn off the connected devices to prevent signal disruption or electrical hazards. Wear ESD gloves or a wrist strap to protect sensitive components from static electricity . 2. Identify and Label Cables Record the locations and labels of all optical fibers on the Huawei module. If labels are unclear, create new ones to ensure correct reconnection later . 3. Release the Connector Lock Different connectors have different locking mechanisms:

- LC/PC connectors: Press down the latch to release.
 - MPO connectors: Pull the latch to release automatically.
 - SC/PC connectors: Pull the latch to release automatically .
4. Gently Remove the Fiber Hold the connector head, not the cable, and pull straight out from the port. Avoid twisting or bending the fiber to prevent damage . 5. Cover Connectors Immediately place dust caps on both ends of the removed fiber and on the optical module ports to prevent contamination . 6. Remove the Optical Module (if needed) If removing the module itself, release the module latch (clasp or tab type) and gently pull the module out. Cover the module bores with dust plugs and store it safely . 7. Coil and Store Cables Properly Do not fold or kink the optical cables. Coil them loosely and store in a clean, dry environment with protective caps on both ends
